Abstract: The authors use a nonexperimental design to examine the effect of a self-help program on the self-efficacy of patients with type 2 diabetes. The test is based on the assumption that the self-efficacy of patients with type 2 diabetes is related to their knowledge of the disease and its management. The results show that the self-efficacy of patients with type 2 diabetes is related to their knowledge of the disease and its management. The results also show that the self-efficacy of patients with type 2 diabetes is related to their knowledge of the disease and its management.
